

1D Histogram of x

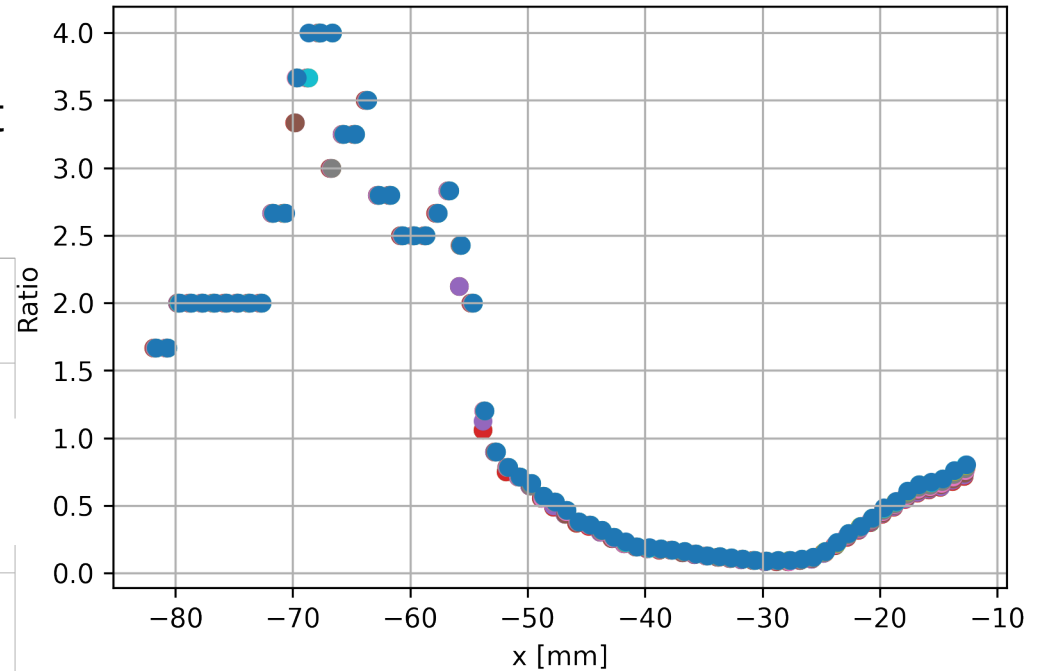

mean_val - offset

mean_val + offset

mean_val

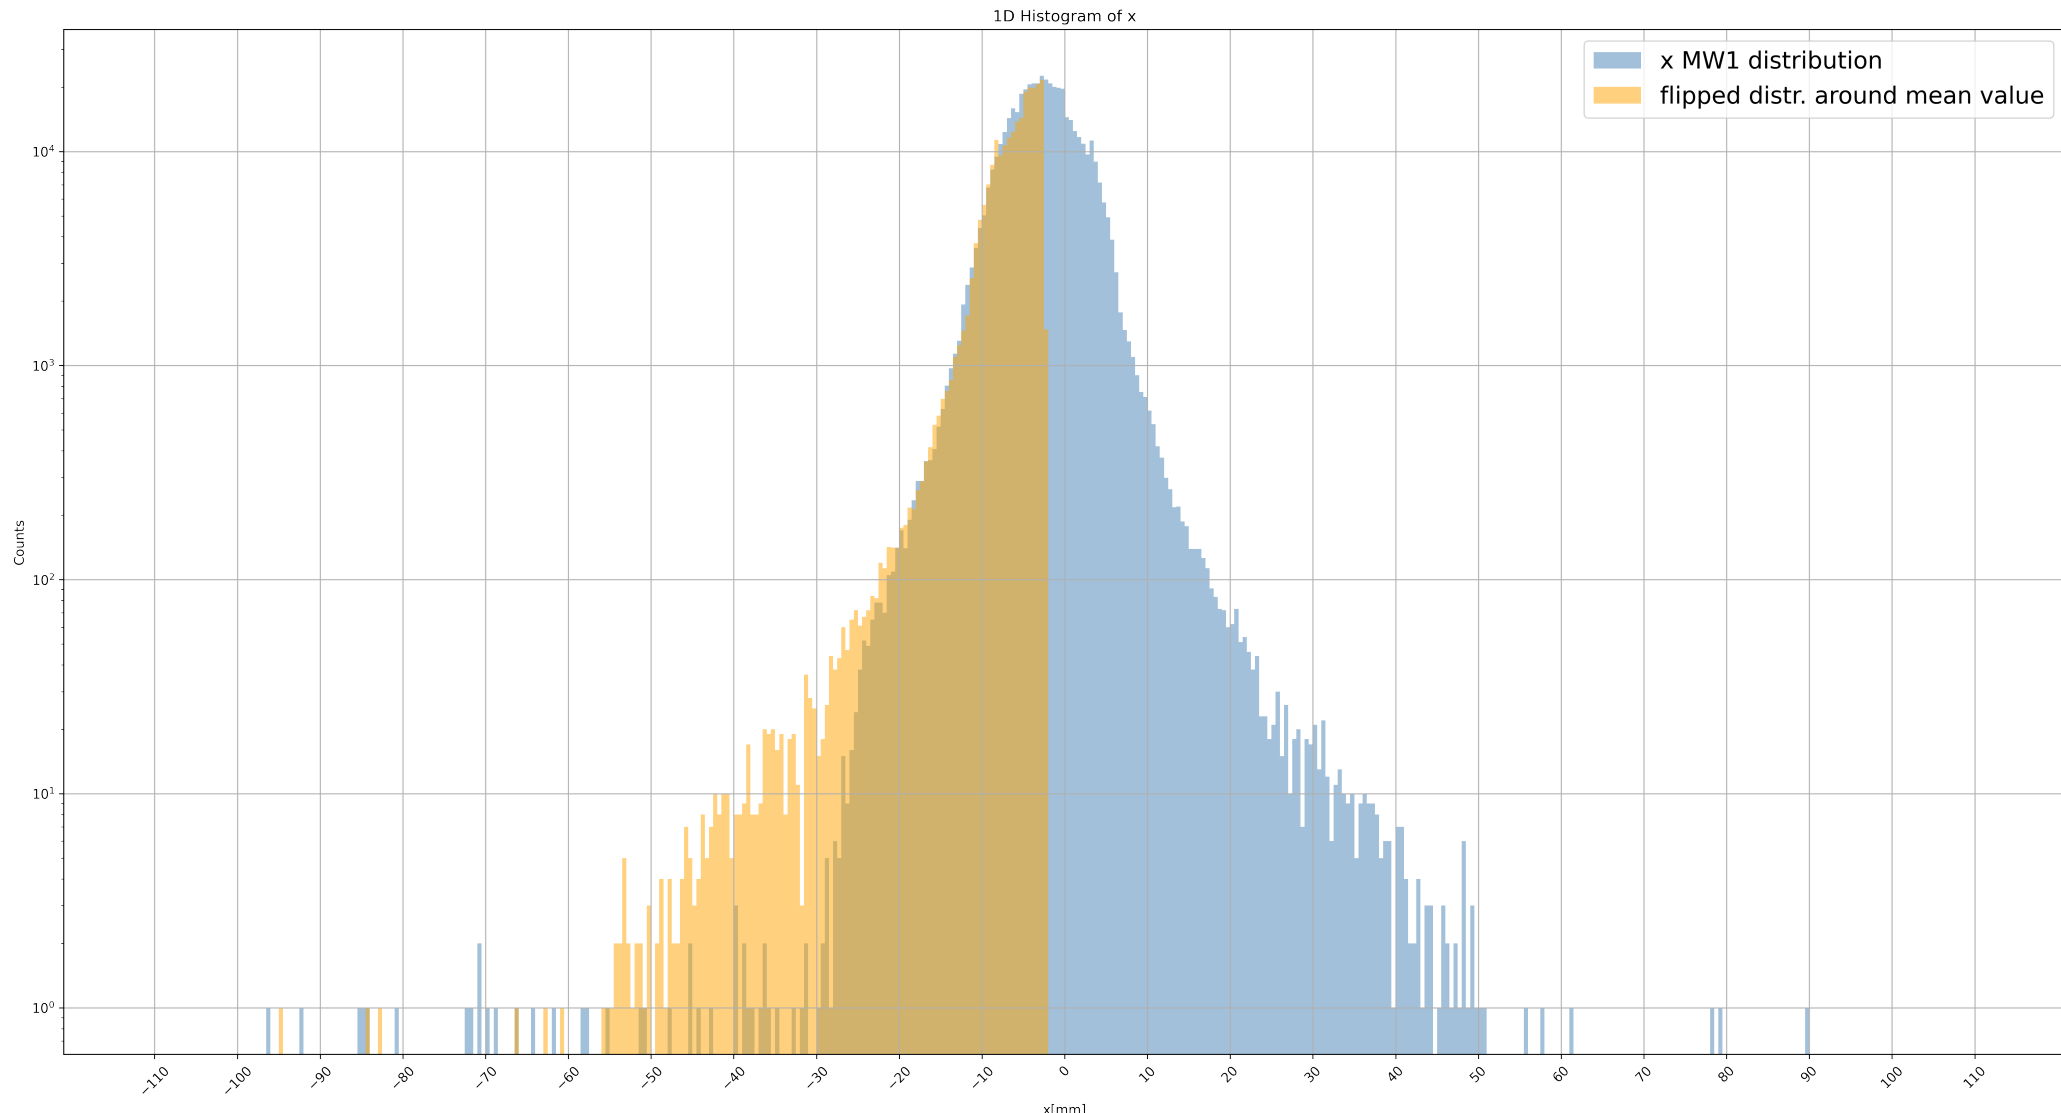

Ratio integral left I_L / integral right I_R

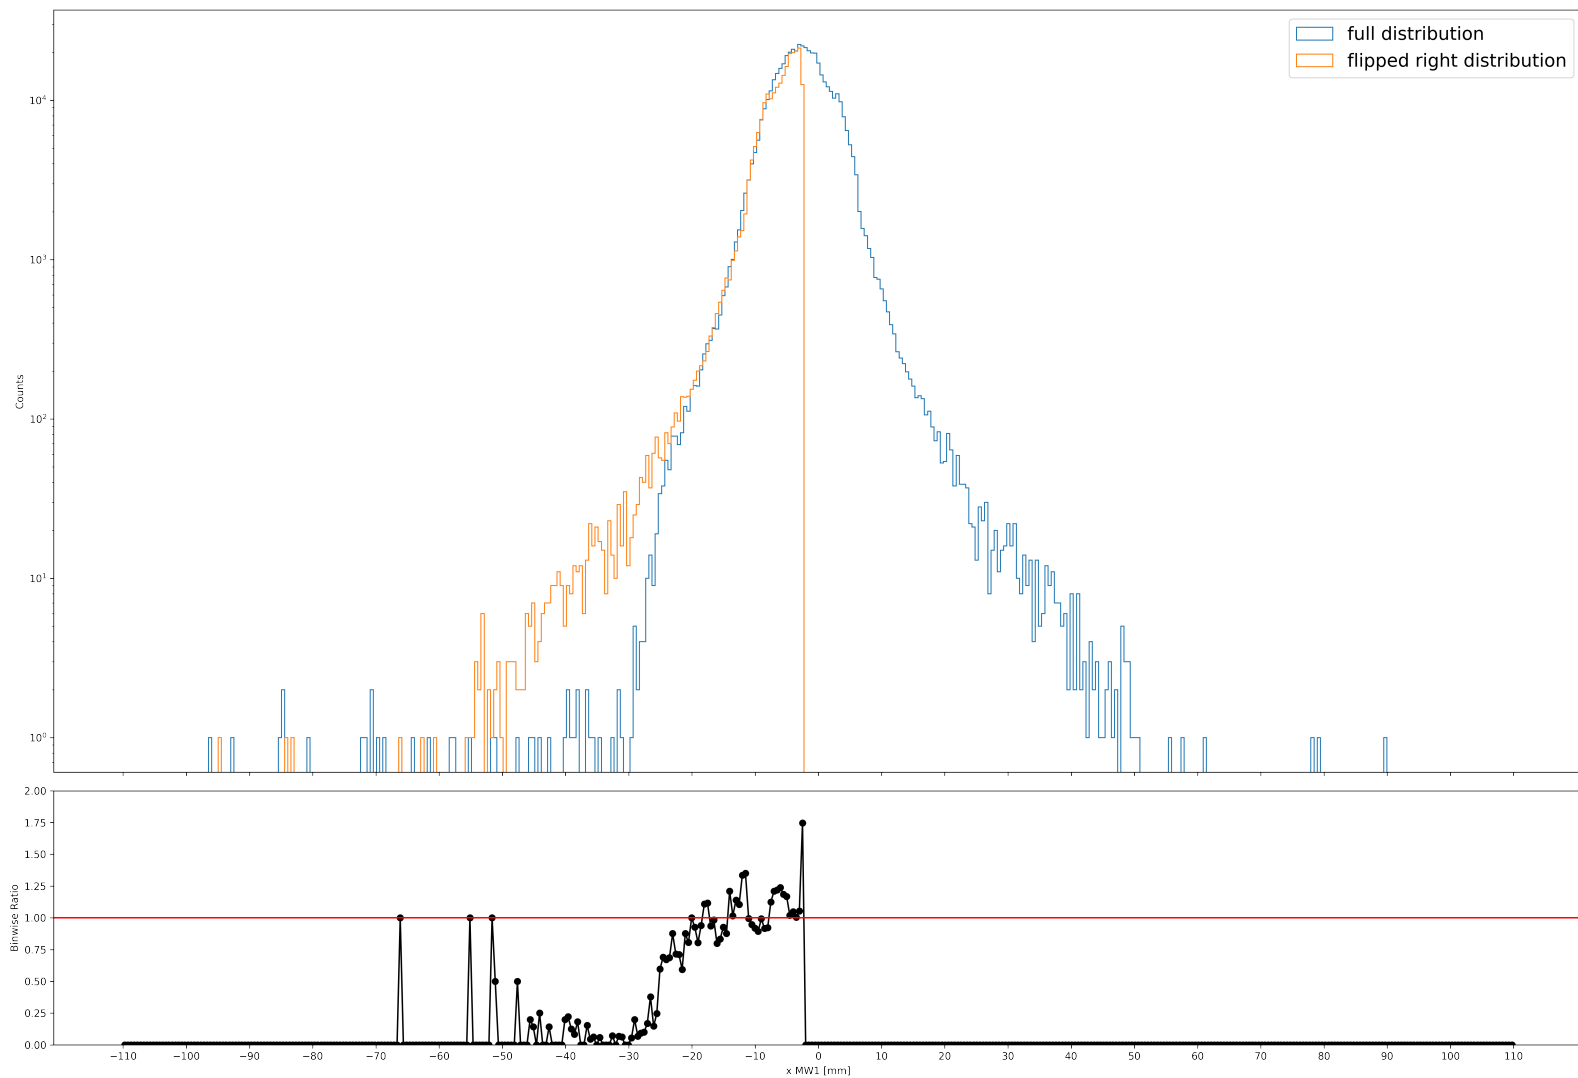

e.g. if you look at point $x = -20$, $y = 0.5$:
ratio of integral from -20 to $\rightarrow -110$
And mean_val+offset $\rightarrow 110$ is ~ 0.5

Where $x = -20 = \text{mean_val} - \text{offset}$

1. Shift mean_val for flipping 0.25 mm to the right (=0.5 bins)

2. bin-wise comparison of entries on the left for orange(flipped) and blue

How if I would have shifted mean_val to -0.5 or $+0.5$?

Left shift (-0.5)

Right shift ($+0.5$)
